

## CLAIMS

We claim:

- 1           1.       A method for administering hydro-acoustic therapy to a patient, said  
2 method comprising:  
3               providing a chamber, said chamber having a volume of liquid;  
4               placing the patient in said chamber such that a portion of the patient is  
5 immersed in the liquid; and  
6               propagating low frequency acoustic waves through the liquid, such that  
7 said acoustic waves mobilize respiratory secretions in lungs of said patient.
- 1           2.       The method of claim 1, wherein liquid comprises water.
- 1           3.       The method of claim 2, wherein the step of placing comprises immersing  
2 the patient in said water such that a lung of the patient is fully submersed in said water.
- 1           4.       The method of claim 2, wherein the step of propagating further comprises  
2 causing said frequency and an amplitude of said acoustic waves to vary as a function of  
3 time.
- 1           5.       The method of claim 3, wherein said volume of water has a minimum  
2 mass of about three times a displaced mass of said lung of the patient.
- 1           6.       The method of claim 3, wherein said acoustic waves have a frequency  
2 below about 120 Hertz.

1           7.       The method of claim 6, wherein said introducing step comprises uniformly  
2       stimulating said lung by causing said lung to oscillate at a resonant frequency of said  
3       lung.

1           8.       The method of claim 7, wherein said patient is afflicted with cystic  
2       fibrosis.

1           9.       The method of claim 7, wherein said patient is afflicted with chronic  
2       obstructive lung disease.

1           10.      The method of claim 7, wherein said patient is afflicted with lung cancer.

1           11.      The method of claim 7, wherein said patient is afflicted with pneumonia.

1           12.      A method for the medical treatment of a person, said method comprising:  
2                    providing a chamber containing a fluid;  
3                    placing a person in said chamber such that a body of the person is  
4       immersed in said fluid; and  
5                    introducing acoustic vibrations into said fluid, said vibrations causing the  
6       mobilization of respiratory secretions in said person.

1           13.      The method of claim 12, wherein said fluid comprises water.

1           14.     The method of claim 13, wherein said placing step comprises immersing  
2     the person in said fluid such that a body of the person is fully immersed in said fluid  
3     below a neck area of the person.

1           15.     The method of claim 13, wherein said acoustic vibrations are low  
2     frequency vibrations.

1           16.     The method of claim 13, wherein the step of propagating further comprises  
2     causing said frequency and an amplitude of said acoustic waves to vary as a function of  
3     time.

1           17.     The method of claim 15, wherein said acoustic vibrations are below 120  
2     Hertz.

1           18.     The method of claim 17, wherein said acoustic vibrations cause a lung of  
2     the person to oscillate at the fundamental resonance frequency of said lung.

1           19.     The method of claim 14, further comprising the steps of:  
2                   determining a resonance frequency of a lung of said person; and  
3                   causing said acoustic vibrations to operate at said resonance frequency of  
4     said lung.

1           20.     The method of claim 14, further comprising the step of positioning a  
2     monitoring device near a chest area of the person such that an effect of said acoustic  
3     vibrations on the person is monitored.

1                   21.     The method of claim 20, wherein said monitoring device comprises a  
2     hydrophone.

TKHR Docket No.: 062004-1640

1           22.    A method for determining a resonant frequency of lungs of a patient,  
2   comprising the steps of:  
3                providing a chamber containing a fluid;  
4                placing a hydrophone in said chamber;  
5                causing acoustic vibrations at a first frequency and changing a frequency  
6   of said acoustic vibrations to a second frequency;  
7                recording a first output of said hydrophone as said acoustic vibration  
8   frequency is increased;  
9                computing a first transfer function of said first output;  
10              placing a person in said chamber such that a body of the person is  
11   immersed in said fluid;  
12              positioning said hydrophone near a chest area of the person;  
13              causing acoustic vibrations at said first frequency and changing said  
14   frequency of said acoustic vibrations to said second frequency;  
15              recording a second output of said hydrophone as said acoustic vibration  
16   frequency is increased;  
17              computing a second transfer function of said second output;  
18              plotting a ratio of said first transfer function to said second transfer  
19   function versus said frequency of said acoustic vibrations; and  
20              identifying a maximum of said plot as a resonant frequency of said lung.

1           23.    An apparatus for administering hydro-acoustic therapy for a patient, said  
2 device comprising:

3           a chamber having walls, said chamber having a volume of a fluid; and  
4           an acoustic generator that generating acoustic waves in said fluid of said chamber,  
5 wherein said acoustic waves are low frequency vibrations.

1           24.    The apparatus of claim 23, further comprising a supporting structure for  
2 permitting a person to sit in the chamber, partially submersed in said fluid, during  
3 treatment.

1           25.    The apparatus of claim 24, further comprising a hydrophone positioned  
2 near a chest of said person in said fluid, said hydrophone for monitoring a response of  
3 said person to said acoustic waves.

1           26.    The apparatus of claim 23, wherein said fluid comprises water.

1           27.    The apparatus of claim 26, wherein said chamber walls are rigid and  
2 define a generally cylindrical chamber.

1           28.    The apparatus of claim 27, wherein said chamber further comprises an  
2 orifice in a wall, wherein said orifice is covered by a flexible membrane.

1           29.    The apparatus of claim 28, wherein said acoustic generator comprises a  
2 means for causing said membrane to oscillate in periodic motion.

1           30.    The apparatus of claim 29, wherein said causing means comprises a piston  
2   outside of said chamber and directed to press against said membrane in order to cause  
3   said periodic motion.
